Fall 2017 Math 138 Topics for the second exam
Preliminaries about functions. Know:
$>$ Formal definition of a function.
$>$ Formal definitions of injection, surjection and bijection; important examples of bijections and definitions of the important inverse functions (relevant material posted on September 26 and September 27)
$>$ The definition of the composition of functions and have understanding of the website post on September 29 related to this definition

Limits, continuity Know:
$>$ The formal definition of limit at $+\infty$ posted on October 2 and how to apply this definition in simple examples (posts of October 2 and October 3)
$>$ The $\epsilon-\delta$ definition of limit at a point $a$ and how to apply this definition in simple examples (post of October 4)
$>$ Proofs posted on the website on October 5. (This is closely related to the Lipschitz condition for the existence of limit posted on October 11)
$>\epsilon-\delta$ definition of continuity of a function at a point and how to apply it in simple examples (posts on October 7, October 10 and October 11)
> The Intermediate Value Theorem and the Extreme Values Theorem and how to apply them in simple situations

## Derivatives. Know:

$>$ The formal definition of differentiability and derivative of a function and how to apply these definitions in simple examples (post of October 19)
$>$ the concept of the tangent line to a graph and its connection to the definition of derivative and how to calculate tangent lines to simple graphs
$>$ Using tangent lines and normal lines to graphs to find specially positioned circles (October 19 and 20)
$>$ The definition of Lambert's $W$ functions and how to use them to solve simple problems, posts of October 27 and October 30.

Differentiation. Know:
$>$ The statement and the geometric interpretation of the mean value theorem and its consequences.
$>$ How to find higher order approximations and the osculating circle for a function at a point, posts of October 31 and November 2
$>$ How to solve optimization problems using properties of differentiable functions, post of November 3
$>$ The geometric relationship between the derivative of a bijection and its inverse and how to use it to calculate derivatives of the inverse.
$>$ How to do implicit differentiation and how to use it to analyze simple implicit equations, post of November 7
$>$ How to construct parametric equations of simple planar curves and their tangent lines, post of November 8 and 9 .
$>$ How to calculate the envelope of a simple family of lines, post of November 13. In particular, how to construct a family of normals to a graph and calculate their envelope and the relationship of this curve to the evolute, post of November 14.
